

Tutor feedback on the proposal outline

Your proposal demonstrates a well-structured and contextually relevant approach to addressing educational challenges in Qatari primary schools using AI. The research problem is clearly articulated, and the project's aims, question, and objectives are well-aligned. Your use of Design Science Research is appropriate for developing and evaluating an educational artefact, and the proposed system features show clear practical value. Ethical considerations are addressed thoroughly, particularly in relation to data privacy and bias.

However, to enhance the academic depth, your literature section should engage more critically with key authors and studies. The justification for choosing DSR would benefit from clearer articulation, especially compared to alternative approaches. Your evaluation methods need more detail—particularly regarding how you will assess usability and impact in a structured way. The artefact description could also be improved by outlining potential tools, models, or technologies to be used. Lastly, visual elements like a Gantt chart should be included in your final presentation to improve clarity and pacing.

Overall, you are on the right path. Strengthening the academic criticality and methodological justification will ensure your project meets MSc-level expectations.
